DETAILED ACTION

1. Applicant's arguments with respect to claim 1 have been considered but are moot in view of the new ground(s) of rejection.

Claim Objections

2. Claim 1 is objected to because of the following informalities: recitation: "n phases" and "m-times the given signal" lack further definition of parameters for "n and m". The original claim recitation can be interpreted as n equals to any given number and m equals to any given number. Therefore, n can be equal to m. Appropriate correction is required.

Claim Rejections - 35 USC § 102

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in a patent granted on an application for patent by another filed in the United States before the invention thereof by the applicant for patent, or on an international application by another who has fulfilled the requirements of paragraphs (1), (2), and (4) of section 371(c) of this title before the invention thereof by the applicant for patent.

The changes made to 35 U.S.C. 102(e) by the American Inventors Protection Act of 1999 (AIPA) and the Intellectual Property and High Technology Technical Amendments Act of 2002 do not apply when the reference is a U.S. patent resulting directly or indirectly from an international application filed before November 29, 2000.

Therefore, the prior art date of the reference is determined under 35 U.S.C. 102(e) prior to the amendment by the AIPA (pre-AIPA 35 U.S.C. 102(e)).

4. Claim 1 is rejected under 35 U.S.C. 102(e) as being anticipated by Dent (5,834,987).

Regarding claim 1, Dent discloses a digitally controlled circuit for reducing a phase modulation of a given signal, comprising:

a multiphase clock generator (104 in Fig. 3) producing n phases of a clock being m -times the given signal;

a multiplexer (106 in Fig. 3) connected to said multiphase clock generator and having n inputs for receiving the n phases of the clock, said multiplexer having one output supplying an output signal (as shown in Fig. 3);

a phase comparator (100 in Fig. 3) having inputs receiving the output signal of said multiplexer and the given signal (FREF), and generating a compared output signal; and

a sigma-delta modulator (107 in Fig. 3) connected to said phase comparator and receiving said compared output signal, said sigma-delta modulator generating correction commands used for controlling said multiplexer (N/N+1 CONTROL in Fig. 3).

Allowable Subject Matter

5. Claims 2-9 are allowed.

6. The following is an examiner's statement of reasons for allowance:

- a) Regarding claim 2, none of the prior teaches or suggests a phase-difference accumulator and a phase-difference transformer in connection with a phase comparator and a sigma-delta modulator.
- b) Regarding claim 3, none of the prior teaches or suggests a second sigma-delta modulator being connected to a phase comparator.
- c) Regarding claim 7, none of the prior teaches or suggests a sigma-delta modulator being a binary adder.
- d) Regarding claim 9, none of the prior teaches or suggests four phases of a clock being four times a given signal.

Claims 4-6 and 8 are allowed since they are dependent upon the independent claims 2, 3, 7, and 9.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
